Prefatory Note

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies, ¹ and then making the scanned versions text-searchable. ² Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

¹ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

² A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

MONEY MARKET AND RESERVE RELATIONSHIPS

Money markets

Recent developments. In late November and early December before the discount rate increase the money market was coming under seasonal pressure. Federal funds traded mostly at 4-1/8 per cent-but also with increasing frequency at 4-1/4 per cent-dealer loan rates moved into a higher range, and bill rates continued to edge upward.

Following the discount rate advance, short-term market rates generally, including those on Treasury bills, bankers' acceptances, commercial paper, and certificates of deposit, adjusted up by 1/8 - 1/4 per cent. The Federal funds rate, after some temporary easing toward the end of the December 8 statement week, moved back to around the new discount rate and dealer lending rates have also risen to and slightly above 4-1/2 per cent.

The 3-month bill so far has fluctuated around the 4.34 per cent issuing rate in the auction that followed the discount rate announcement; this rate is apparently being influenced by the small supply of short-term bills currently in dealer hands.

CD issuing rates posted by New York banks shortly after the discount rate action ranged from 4-3/8 - 4-1/2 per cent for 30-89 day money to 4.65 - 4.75 per cent for 6-month and longer-term deposits.

A national strucutre of CD rates has not yet taken form, but one large bank today posted a rate of 4-3/4 per cent for 90-day CD money.

December 10, 1965.

^{1/} Base is average for month preceding specified period.
2/ Time deposits, adjusted, at all commercial banks; differs from time deposit required reserve series in Table A-2 since latter includes only member banks. P - Preliminary.

In the December 8 statement week, free reserves averaged \$9 million as the System purchased a sizable amount of bills to cushion the impact of the discount rate increase. Member bank borrowings remained relatively high at \$478 million, however, in reflection of some apparent overborrowing in districts that still had a 4 per cent discount rate. In the previous five weeks, net borrowed reserves and member bank borrowings averaged about \$85 million and \$440 million, respectively.

Prospective developments. The combination of the recent discount rate action, widely fluctuating seasonal pressures over the next four weeks, and forthcoming Treasury financings make estimation of prospective interrelationships among money market variables especially difficult at this time. If it were to be the Committee's intent to moderate (but not fully offset) further adjustments of money and credit market conditions, the staff estimates that net borrowed reserves ranging around \$100 million would likely be associated with bill rates in a 4.30 to 4.45 per cent range. Some seasonal pressure on dealer loan rates is to be expected and rates in New York may climb to around 4-3/4 per cent, which may put some upward pressure on bill rates. Federal funds should commonly trade at 4-1/2 per cent and occasionally at 4-5/8 per cent. Chances of the development of a premium funds rate will be lessened if banks find it possible to obtain short-term CD money at rates around the discount rate.

The increase in CD ceiling rates seems to have eased the possibility of a serious money market bind, especially around and immediately after the tax date. But it is not yet clear how aggressive banks will be in seeking CD money, and this raises the possibility of repercussions on the bill market. In addition, the forthcoming new supply of bills from Treasury financings could be a factor off-setting the usual seasonal tendency for short-term rates to decline after tax date pressures abate and as investment funds become increasingly available early in the new year.

Long-term interest rates, like short-term rates, seem to have passed through an initial phase of their adjustment to the discount rate action. Little change in long-term rates is likely in the weeks immediately ahead, and even some small and technical rallies cannot be ruled out. On the other hand, the possibility of significant additions to the corporate calendar and disclosure of the full dimensions of the Treasury's probable cash financings in January (around \$3 billion) may disturb the current balance of market forces. Reserve flows, bank credit, and money

Recent developments. In November, total reserves of member banks turned down by an amount almost equal to their October rise, as reserves required behind both private and Government demand deposits declined. Nonborrowed reserves increased at a somewhat slower pace than in the previous month, while borrowed reserves declined contraseasonally.

Prospective developments. Expansion in total reserves appears likely to resume in December, encouraged by heavy year-end credit demands and by a larger than seasonal rise in Government deposits. Nonborrowed reserves should also continue to rise although, despite the discount rate increase, banks may tend to cover somewhat more of reserve needs through borrowings than they did last month, when the power failure and even keel around the mid-November refunding tended to keep borrowings down.

The System generally will be a seller of Government securities in coming weeks, as reserves are supplied by the usual Christmas float bulge and then, in January, by the return flow of currency from circulation and seasonal loan repayments.

Bank credit growth on a daily average basis will be considerably higher in December than November, reflecting in part the temporary bulge of banks' underwriting of the Treasury bill financing in late November. For the two months November-December combined, an annual growth rate of 8-9 per cent might be expected, close to the average for the year to date.

The amount of increase in bank credit in December depends partly on banks' willingness and ability to obtain additional CDs, given the flexibility under the new ceilings. In view of the large CD maturities in December, and the reduced corporate liquidity positions, the annual rate of net time deposit acquisition may drop off to around 10 per cent this month, as compared with almost 17 per

cent in the two previous months. Parallel with this, however, private demand deposits are likely to resume expansion this month, at around a 4-5 per cent annual rate. This would bring private demand deposit expansion for the year as a whole to near 4 per cent, about the same as last year.

^{1/} For retrospective details, see Table B-4.

p - Preliminary.

For required reserves by type of deposits, see Table B-2.

^{2/} For factors included, see Table B-3. 3/ For required reserves by type of depotential of the second of the seco See reverse side for explanation of projections.

Explanation of Projections in Table B-1

- 1. Changes in Federal Reserve credit indicate reserves needed to offset projected changes in required reserves and factors affecting the supply of reserves.
- 2. Projected changes in currency outside banks reflect seasonal movements plus an allowance for growth of about \$30 million per week.
- 3. Projected effects of Treasury operations, included in "technical factors," reflect scheduled and assumed calls in current two weeks and thereafter, maintenance of Treasury balances with Federal Reserve at \$600 million.
- 4. Projected changes in gold stock reflect assumed outflow after December at the rate of about \$50 million per month.
- 5. Projected changes in required reserves reflect estimated seasonal movements in private deposits, except as indicated in projections in Table B-2, and projected movements in U.S. Government demand deposits. Government deposit projections are based on anticipated Treasury receipts and expenditures and the following assumed financing operation: \$2.2 billion, Jamesry 7.

^{1/} Includes all deposits subject to reserve requirements--i.e., the total of time, private demand, and U.S. Government demand deposits. Movements in this aggregate correspond closely with movements in total member bank credit.

^{2/} Private demand deposits include demand deposits of individuals, partnerships and corporations and net interbank balances.

p - Preliminary.

rt Reference Table C-3 MONEY SUPPLY BY COMPONENTS

Seasonally Adjusted (Dollar amounts in billions, based on monthly averages of daily figures)

Period	Money Supply	Demand deposits <u>1</u> /	Currency <u>2</u> /
